

ET Summit 2024

Presented by

GAHP Sizing

Cristalle Mauleon
Engineering Manager
Lincus, Inc.

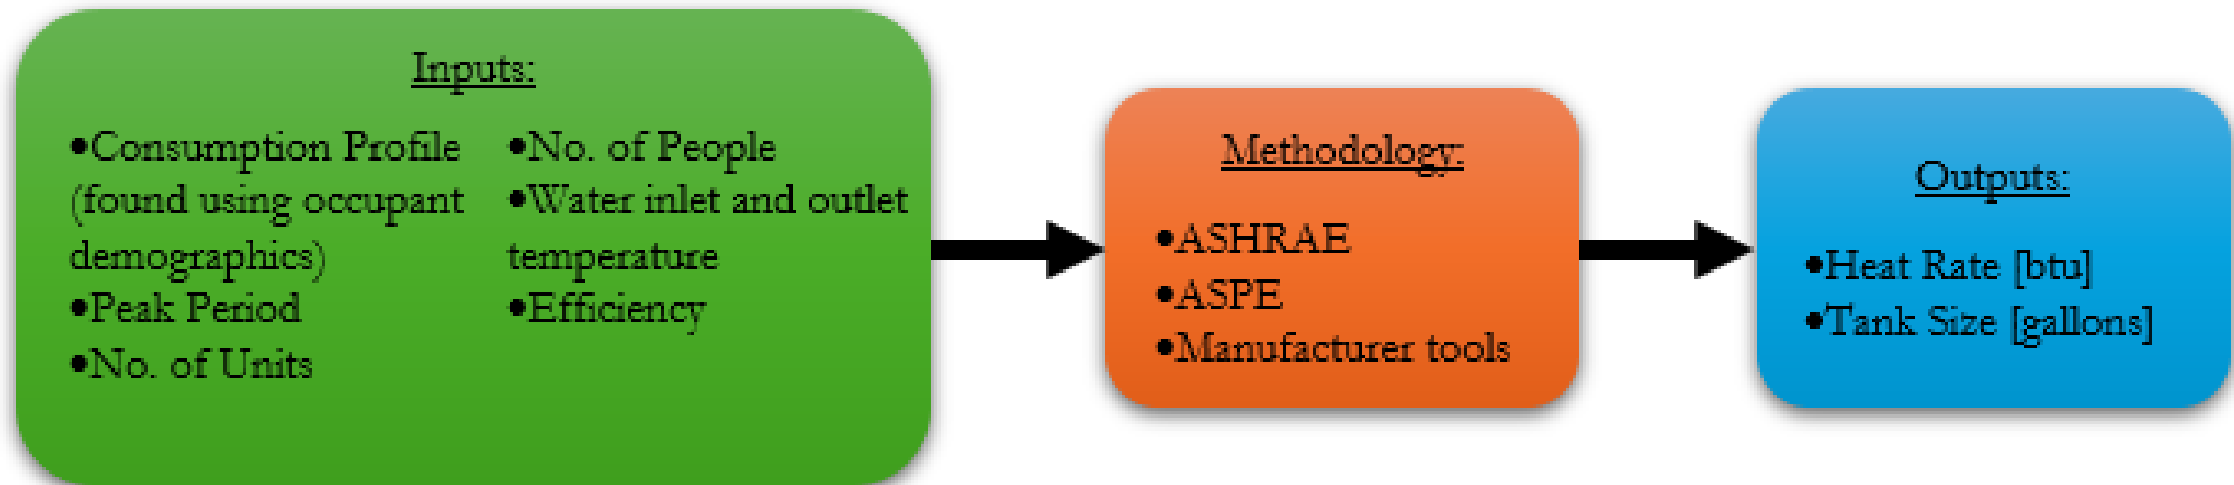

Agenda

- **DHW Sizing Tools**
- **Comparing DHW Loads to DHW Sizing Tools**
- **Site Screening Recommendations**
- **Conclusion**

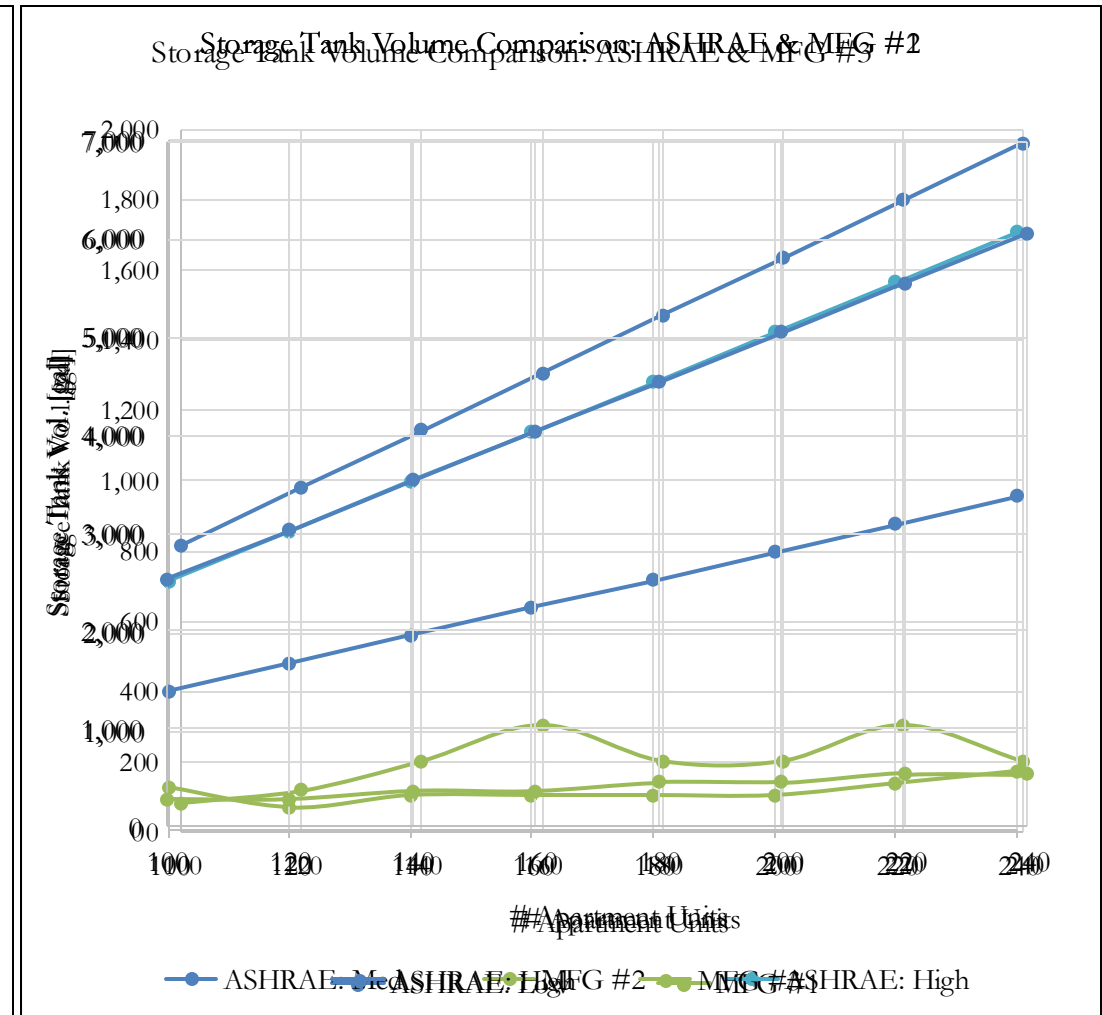

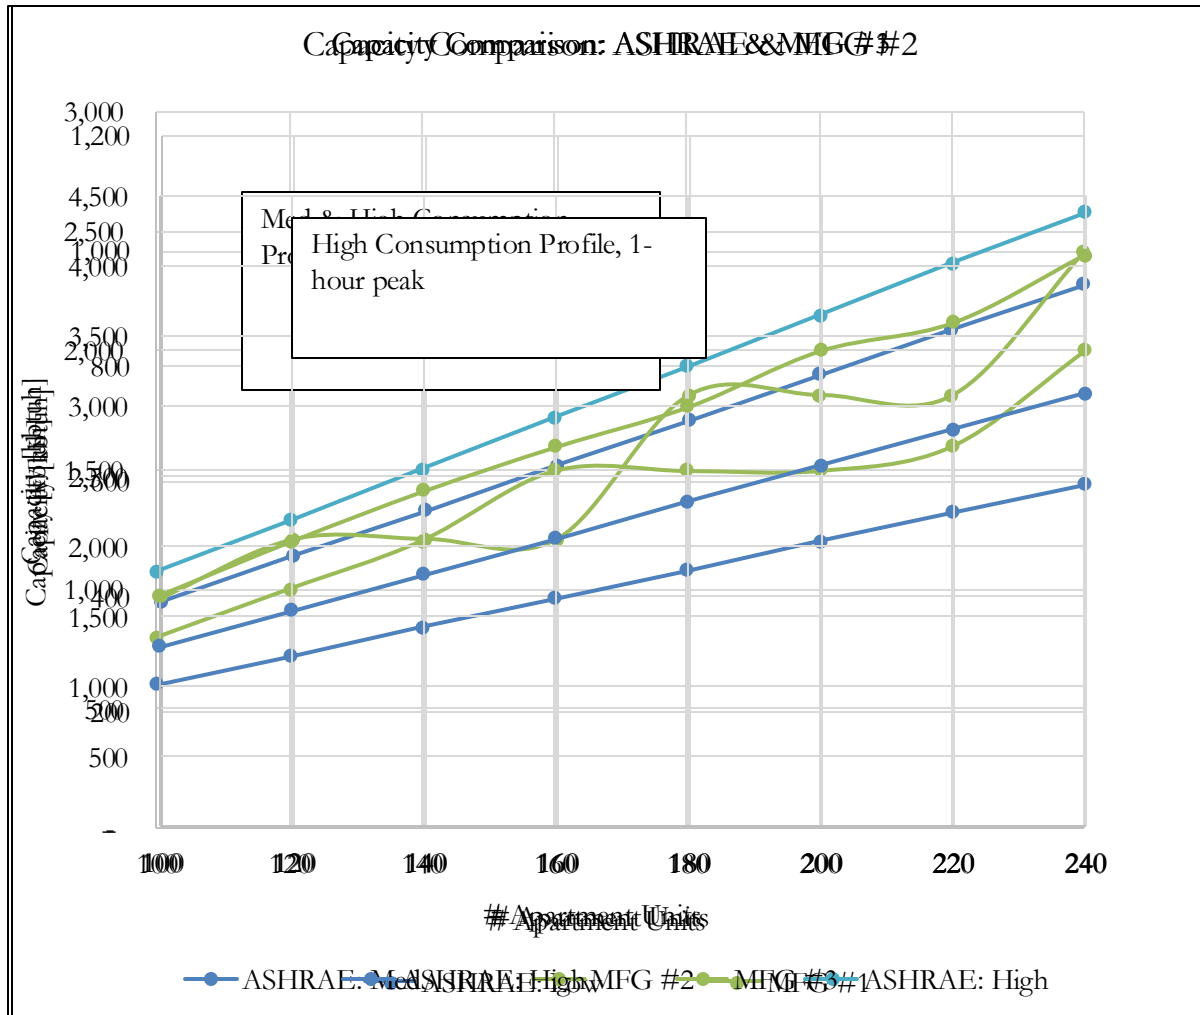

Comparing Water Heater Sizing Methods

- Literature review of DHW Sizing methods
- ASHRAE and ASPE are considered the same
- 3 manufacturer tools were considered, each with different load profiles

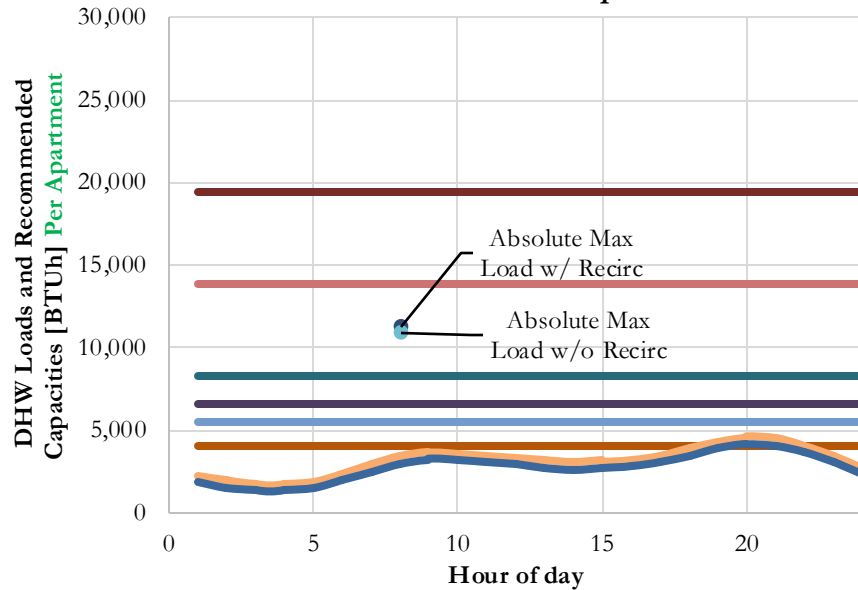

Comparison: ASHRAE v. Manufacturer Tools

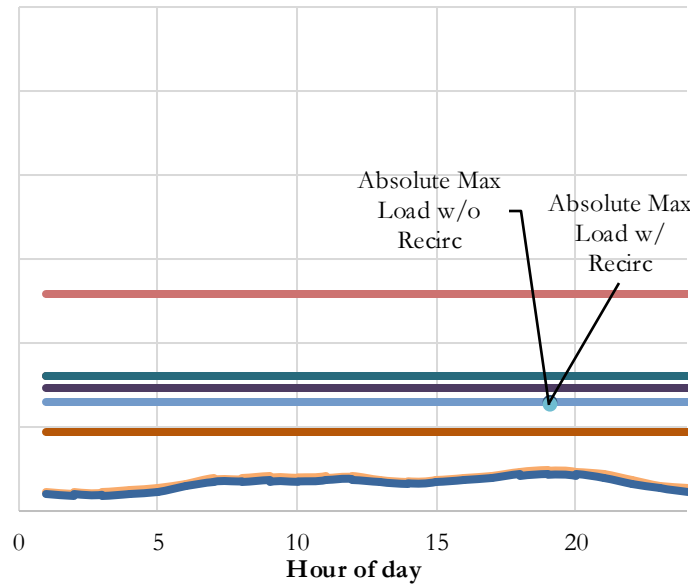

Comparing Actual DHW Loads to DHW Sizing Tools

- **Data Sources**
 - **Hourly gas billing data** for multifamily properties in California
 - Compared to **ASHRAE, Manufacturer tools, and EHPWH sizing tool**
- **Purpose:**
 - Compare **max DHW loads** to sizing tool recommendations.
 - Highlight significant **oversizing** by DHW tools.

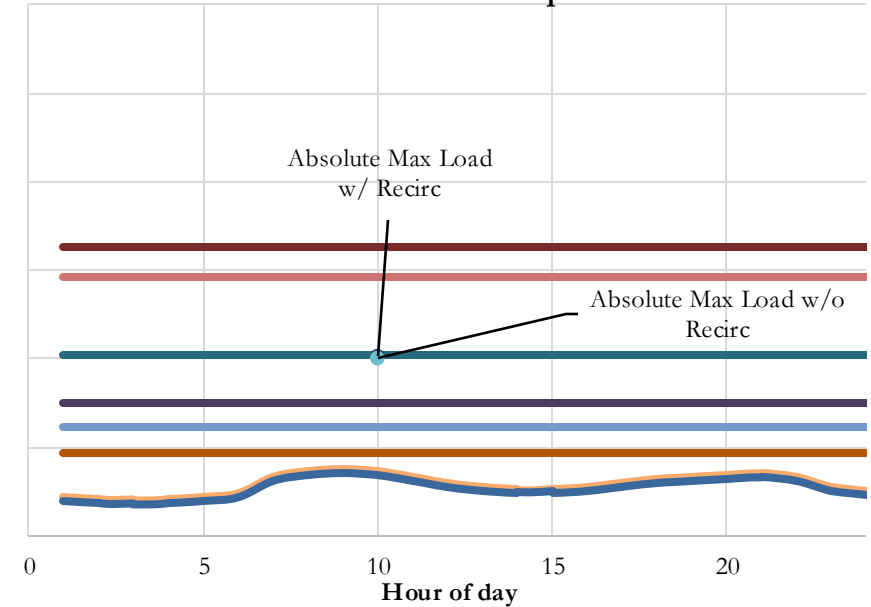

Site 1 DHW Load Comparison

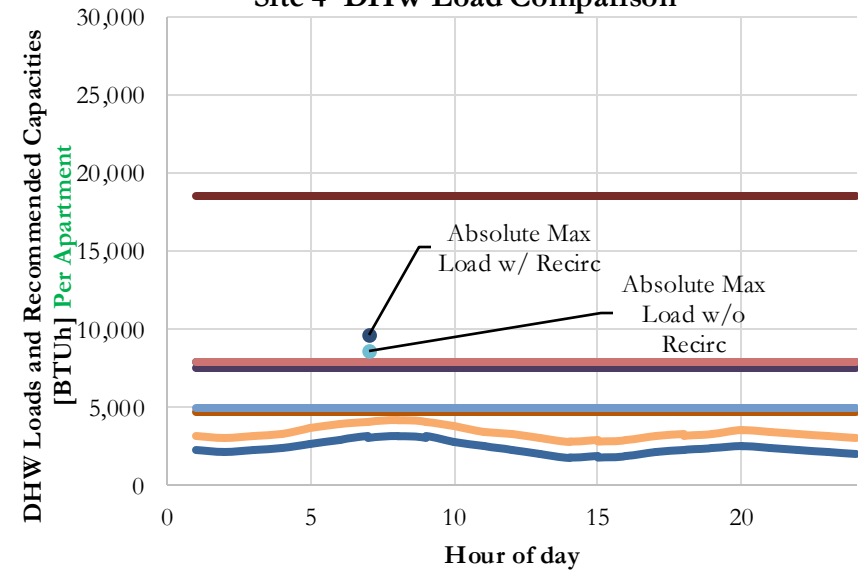

Site 2 DHW Load Comparison

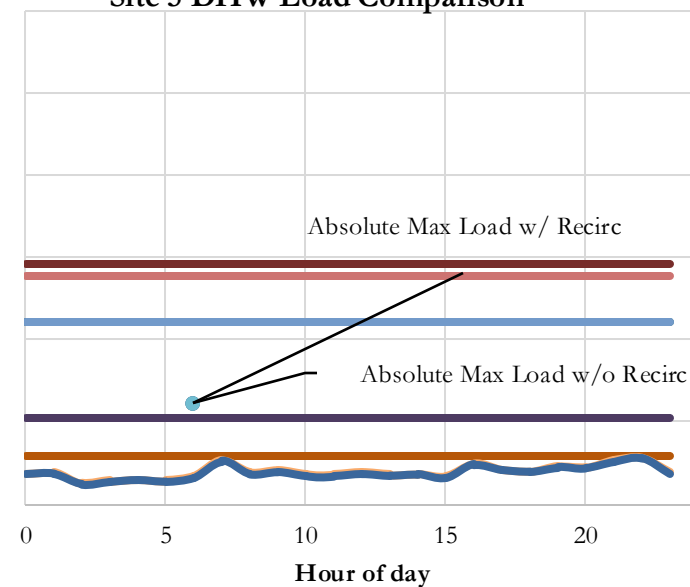

Site 3 DHW Load Comparison

Site 4 DHW Load Comparison

Site 5 DHW Load Comparison

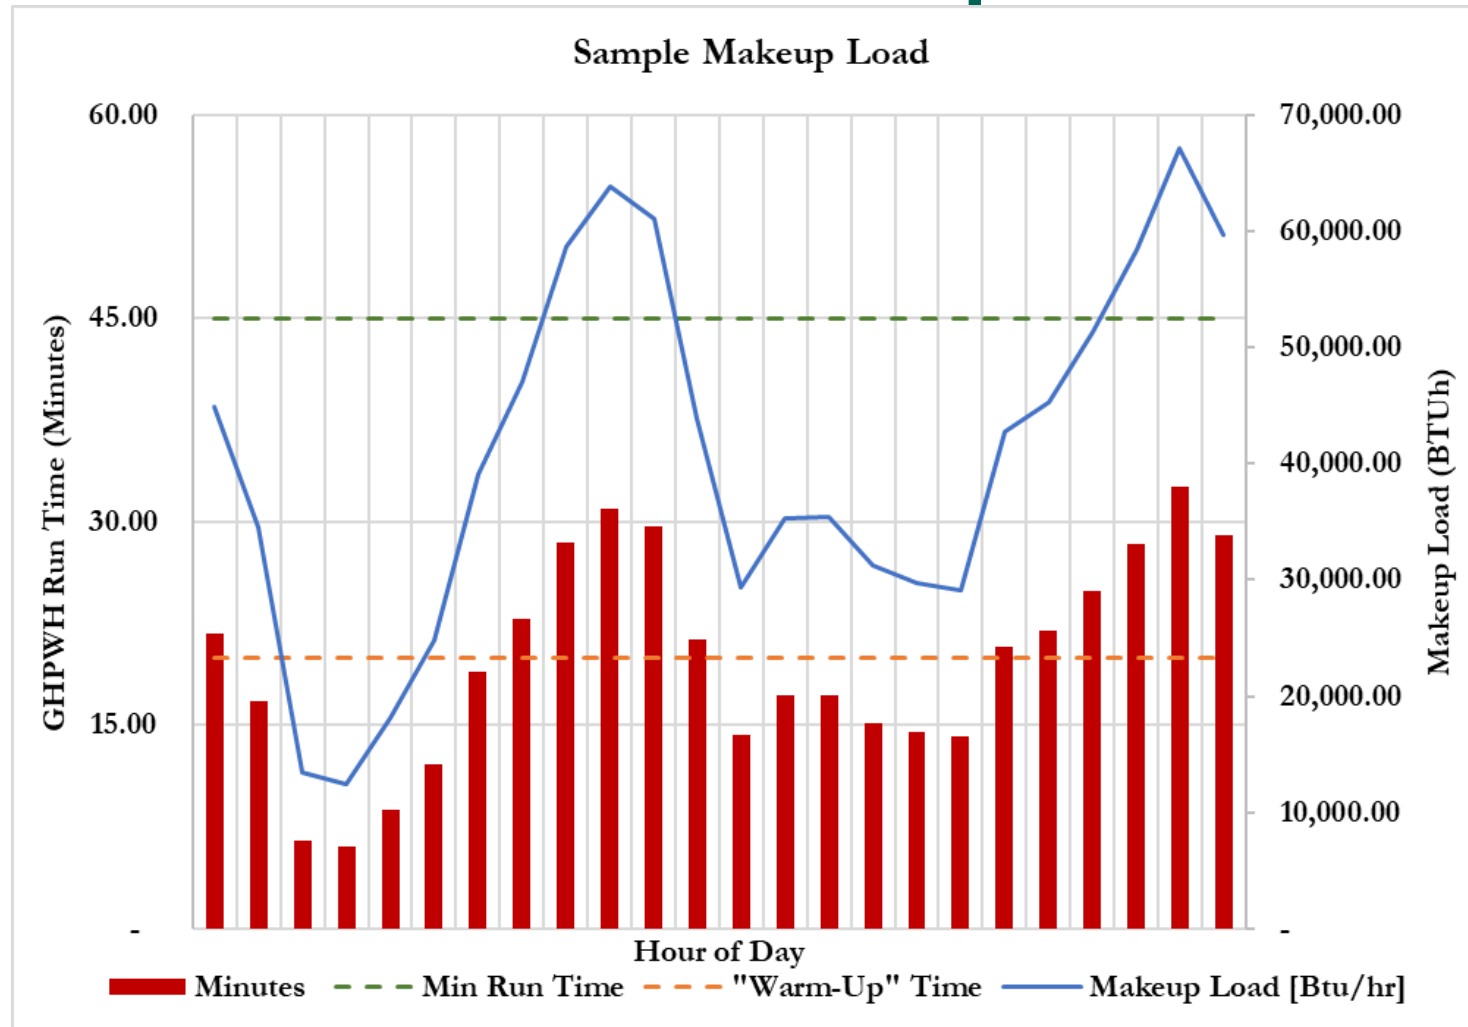

- Absolute Max Load w/ Recirc
- Available on site
- ASHRAE
- MFG #3
- EHPWH Tool
- MFG #1
- MFG #2
- Absolute Max Load w/o Recirc
- Avg Winter DHW Load w/ Recirc
- Avg Winter DHW Load w/o Recirc

Comparing Actual Water Heating Loads to Manufacturer Recommendations

- Key insights
 - **Absolute Max DHW Loads** at all sites exceed **average winter DHW loads**
 - **DHW Sizing Tools** commonly oversize systems to handle worst-case scenarios
 - Traditional Boilers cycle more when oversized - not perceived as an issue
 - **Oversizing HPWHs** leads to **inefficiency**
 - **HPWHs** size based on **average DHW loads**, conventional boilers used **absolute max**

Gas Absorption Heat Pump (GAHP) Water Heater Example

Site Screening Recommendations

- **Pre-Heat Configuration:**

- GAHP handles **average load**, gas boiler supports **peak demand**.

- **Hot Water Demand:**

- Minimum **flowrate** required, based on GAHP capacity and temperature difference.

- **Operational Efficiency:**

- **Continuous heating loads** preferred; avoid short cycling with minimum flow rates.
- GAHP performance varies by **run time** and cycle time.

- **Temperature Limitations**

- **Storage Tank Needs:**

- **Indirect storage tank** for GAHP + boiler system.
- **Buffer tank** with certain MFG

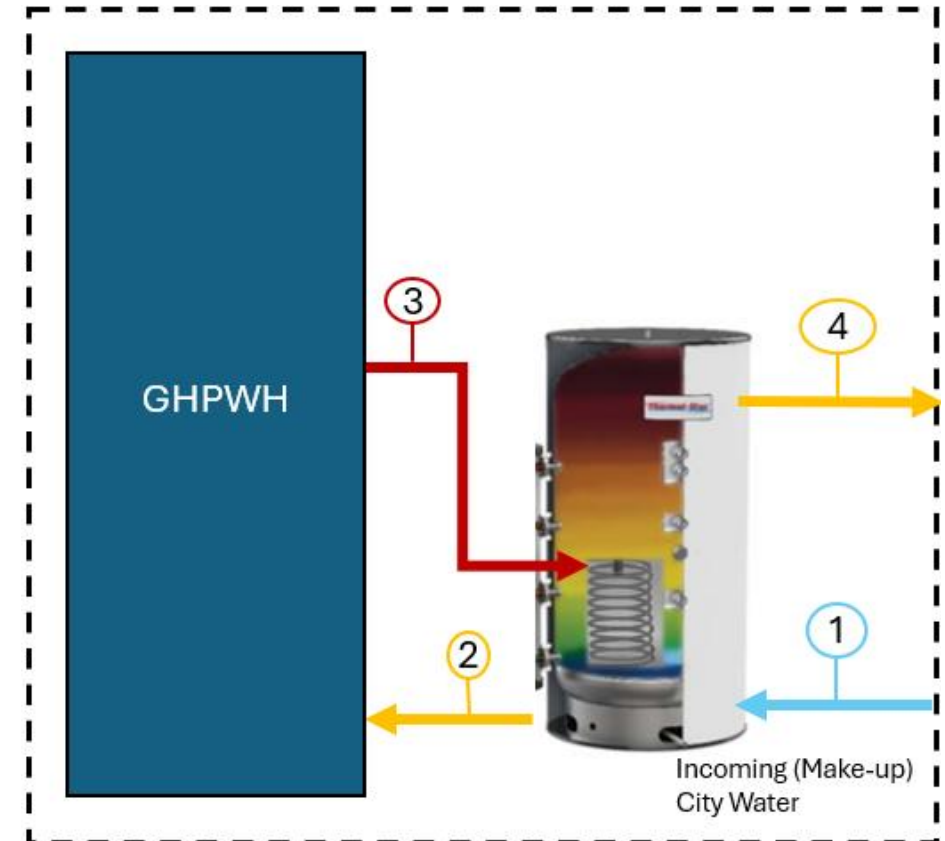

Minimum Flowrate & Indirect Storage Tank Volume

- Minimum Flowrate

$$- \text{Min Flow Rate} \left[\frac{\text{Gal}}{\text{hr}} \right] = \frac{\text{GAHP Capacity} \left[\frac{\text{btu}}{\text{hr}} \right]}{\rho \left[\frac{\text{lbm}}{\text{gal}} \right] c_p \left[\frac{\text{btu}}{\text{lbm-}^\circ\text{F}} \right] \Delta T \left[^\circ\text{F} \right]}$$

- Indirect Storage Tank Vol

$$\text{Indirect Storage Tank Vol [Gal]} = \frac{\text{GAHP Capacity [BTUh]} * \text{GAHP run time [hr]}}{\rho \left[\frac{\text{lbm}}{\text{gal}} \right] c_p \left[\frac{\text{btu}}{^\circ\text{F} - \text{lbm}} \right] \Delta T \left[^\circ\text{F} \right]}$$

Conclusion

- **ASHRAE and manufacturer** tools oversize water heaters at 5 sites compared to average loads.
- Oversizing is problematic for **HPWHs and especially for GAHPs**
 - **EHPWH tool** is most accurate
- **GHPWHs** lack a tool to calculate **base load**
 - Potential solution: Adapt **EHPWH tool** or gather DHW data.

This project was conducted through the ICF implemented, SoCalGas administered California Statewide Gas Emerging Technologies Program.
